

NUAIRE. WIPING OUT MOULD AND CONDENSATION FOR GOOD

NEW DRIMASTEReco
re-inVENTED

Nuaire's DRIMASTEReco range is proven technology

Nuaire have listened to Local Authorities and responded by launching the new DRIMASTER-ECO range; leading the market with advanced technology used by no other manufacturer.

How many of your properties have this problem?

Streaming windows, musty smells and mould growth are the obvious signs of condensation dampness in poorly ventilated homes.

The Drimaster-Eco range offers cost-effective, whole home ventilation for two and three-storey homes with lofts. Their simple and easy installation makes them an ideal solution for retro-fit projects.

PIV WAS
INVENTED
BY NUAIRE
IN 1972

P.I.V IT'S IN OUR DNA

The ultimate cure for condensation and mould in homes with lofts

A principal benefit to this latest PIV innovation is the choice of system control being located either in the unit itself or at the ceiling diffuser.

By positioning the controls within the ceiling diffuser Nuaire have negated the need for any loft access, except for filter replacement. This saves time and money.

Remote sensors are also available which offer automated system control and independent performance evaluation by Local Authority assessors.

What is positive input ventilation?

Nuaire's Positive Input Ventilation systems provide a continuous supply of fresh, filtered air into the home through positive pressurisation, creating an environment in which condensation and mould growth can't exist. PIV is the UK's most popular method of low-energy whole home ventilation.

Features and benefits

- ✓ Cures condensation and mould growth
- ✓ Extremely low power consumption
- ✓ Easy installation and very low maintenance
- ✓ Daily run monitor
- ✓ Improves indoor air quality - a requirement that is becoming increasingly important
- ✓ Remote sensor capabilities with automated system control
- ✓ Remote monitor function allowing system assessment without entering the property
